

Concrete Densifier

WHAT THE CHEMTEC ONE PROCESS CAN DO:

- A. Reduce the porosity of existing concrete & effectively seal out contaminants.
- B. Increase the Surface Hardness and Abrasion Resistance of new and deteriorated concrete.
- C. Increase Compression Strength of new and deteriorated concrete.
- D. Reduce Chloride Penetration.
- E. Inhibit chemical attack of treated concrete.
- F. Form a solid by-product in the micro cracks and gel pores.
- G. Retard scaling of high strength properly finished concrete.
- H. Increase the Mass & Density of concrete.
- I. Produce a sheen on dense steel troweled non-air entrained concrete floors over time.

WHAT THE CHEMTEC ONE PROCESS WILL NOT DO:

- A. **Make good concrete out of bad concrete.**
- B. Correct structural deficiencies.
- C. Correct substrate or erosion problems.
- D. Seal large cracks (Designed to fill alligator, micro and shrinkage cracks).
- E. Totally stop scaling of high slump or non air entrained concrete, or stop mortar flaking due to delaminated surfaces caused by poor finishing.
- F. Fill large voids in concrete due to high water content prior to curing.
